

AMS Capstone Project Topics

Instructions

1. This is a groups assignment of 6 members (7 members only in exigency). Each group may pick any one topic of their choice. Ideally, they should try to pick different topics among groups. An exception may be made when a group comes up with a workable marketing idea (based on summer internships, work experience, case competitions, etc.) and seeks to convert it into a workable dashboard or solution using AI. However, this would require my prior permission.
2. Attempt is to apply AMS concepts to a real, existing brand or product, using AI extensively not as a one-shot prompt for a finished output, but as a tool used at each stage of the thinking. The goal is for groups to reconcile what they've studied against what AI produces: catching gaps, correcting errors, hallucinations and making deliberate calls AI wouldn't make on its own. Thus, reading outputs and making sense is critical.
3. Deliverable format is flexible by topic, a modified print ad, a short report (with the prompt thread linked or logged/ tools used), or a functional web app/dashboards where a topic calls for ongoing monitoring or analysis. Where a web app is used, the underlying analysis should be genuine (real data pulled where feasible, sensibly seeded where not) the app itself should work, not be a mockup of one. However, detail step by step method used (inputs) and output need to be submitted so that it can be checked by me.
4. Deadline for submission is one week post exam (totally NON-negotiable because, there is grade submission deadline for faculty).

Topic 1: Reposition a Brand That Hasn't Moved with its Audience

Pick a real brand whose target audience has likely shifted over the years without the brand catching up. Use AI to explore how the customer base may have changed, decide who the brand should target now, and reposition it accordingly. Translate the new positioning into a modified print ad, keeping the reasoning trail visible in how the brief evolved.

Topic 2: Price-Test a Real Product

Choose a real product and apply a specific pricing method to work out what it should cost. Use AI to pull comparable pricing data, run the method, and stress-test the result against a couple of different scenarios. Present the recommendation and reasoning in a short report, flagging anywhere AI's numbers needed correcting.

Topic 3: Build a Market-and-Idea-Gap Monitor

Build a small, functional web app that watches a real product category, tracks what competitors are doing, and surfaces gaps a new product could plausibly fill. The app's output should reason through the opportunity the way a strategy meeting would, not just list scraped data points. Note briefly which category and brand it's built around.

Topic 4: Build the Case for a Real Brand Extension

Take a real brand that could plausibly extend into a new market, category, or format, and build the full case for it why the opportunity exists and how the launch should happen. Use AI to work through each pipeline stage, noting where its first answer got overridden or refined. Present the complete plan as a short report.

Topic 5: Run a Concept Test on a Plausible New Product

Pick a plausible new product idea for an existing real brand and take it through a proper concept or product testing process. Use AI to help design the test, generate or simulate responses, and interpret what the results actually mean for a go/no-go call. Report what was tested, how, and what the recommended next step is.

Topic 6: Build an Ad Spend vs. Outcome Tracker

Build a small, functional web app that tracks how a real (or realistically modeled) campaign's ad spend compares to the revenue or engagement it drove, and flags whether the spend is paying off. The judgment behind the flags should reflect how campaign performance is assessed, not just a generic chart. Note the brand or campaign it's based on.

Topic 7: Rethink How a Brand Reaches Its Customers

Take a real brand and reconsider how it should reach its customers — which channels make sense given who it's targeting and what it's selling. Use AI to work through the channel decision the way the course frames it, keeping the reasoning trail visible. Present the plan as a short report or a simple walkthrough site.

Topic 8: Segment, Choose, and Speak to One Group

Pick a real brand and build out two or three detailed customer segments using AI. Decide which one the brand should target and be explicit about why the others were set aside. Design a modified print ad that speaks directly to the chosen segment and be ready to show how the ad reflects that segment's profile rather than a generic tagline.

Topic 9: Turn Real Feedback into a Fix List

Build a small, functional web app that pulls in real customer feedback for a real product (reviews, forum posts, or similar) and turns it into a prioritized list of what to fix or improve next. The app's prioritization should reflect how product feedback is actually weighed, not just sentiment scores. Note which product was used and where the feedback came from.

Topic 10: Take an Idea From Gap to Testable Concept

Spot a real, plausible unmet need in a category the group knows well, and take a new product idea for it from rough concept to something that could actually be tested with people. Use AI at each step — idea generation, concept refinement, positioning — and track what changed and why at each stage. Present the concept and its positioning as a short deck or a mock product page.
